Superb coffee from the countertop every time with the CM5 Countertop Coffee Machine

To the delight of coffee connoisseurs, Miele introduces its first exquisitely designed countertop coffee maker, delivering perfect coffee every time in a superb compact and convenient style. Thanks to its compact design, there is space on all kitchen worktops and the CM5100 coffee machine can be neatly stored when not in use. Inside, these machines source their technology from Miele's built-in units.

When Miele first presented the world's first built-in coffee maker in 1998, the idea was to free up space on cluttered worktops. By extending its range to include the CM5100 countertop coffee maker, Miele is addressing the owners of kitchens where space is at a premium: Even in kitchens where there is no more space for another built-in unit, there is still no need to forfeit the pleasure of freshly ground coffee. The new countertop unit comes in black. The design is of a high quality with modern, elegant appeal and meets calls for an easy-to-clean product which blends in with Miele's range of built-in appliances. The elegant stainless-steel spout gives the product the distinctive Miele touch.

Consumers in the market for the CM 5100 are set to profit from the expertise of many years in the production and development of coffee machines, with a wealth of experience from three generations of successful built-in products. The key system components – percolator, pump, heater unit – are identical to those used on the well-established CVA 5000 range, guarantee first-class taste and have all passed Miele's excruciating endurance tests, designed to simulate 20 years of product use. No fewer than 50,000 cups of coffee or espresso are made on test appliances to furnish proof of durability, reliability and longevity.

Alongside a choice of 4 beverage sizes (espresso, coffee, double espresso and double coffee), users can programme parameters to suit their individual needs, including the grind, the quantity of ground coffee per cup and the temperature. Adjustment is intuitive, requiring the use of only the rotary selector and the OK button. In addition to the beans container with a capacity of 250 g, a portion of pre-ground coffee can be processed to meet individual tastes.

Lovers of coffee specialties can also delight with easy to use milk frother. Hot milk and light milk froth are easy to prepare and join freshly percolated espresso in creating a perfect cappuccino or latte macchiato. The height-adjustable spout adapts just as easily to small espresso cups as to a 13 cm latte glass.

The CM5100 coffee machine can be programmed to switch on and off at the desired times. The two-line text display (programmable in 14 languages) and the clear menu

further enhance the user experience. Cleaning and care is both simple and convenient. The percolator can be removed in a series of simple actions and cleaned under running water. The frothing nozzle is just as simple to dismantle and clean under the tap – important when it comes to cleaning the machine after a cappuccino in the morning before setting off to work. Refill indicators remind the user to replenish coffee beans and fresh water. The active heater even preheats cups. The electronic controls on the steam valve allow milk and milk froth quantities to be programmed both simply and precisely. CM5100 making you perfectly ground coffee in every cup.

Notes to Editor:

Miele is a luxury German manufacturer of high quality domestic appliances and commercial equipment founded in 1899 by Carl Miele and Reinhard Zinkann and is one of the largest family-owned and operated appliance company in the world. Miele's success in achieving a synthesis of form and function has resulted in numerous design awards. Prize-winning Miele appliances are on show the world over, not least in the Museum of Modern Art, New York and in the Chicago Atheaneum.
